Assignment 11: Events

### A. Describe Your Event

Write a short paragraph that describes an event-handling process you plan to implement on your product website. Your description must include:

- The element the user will interact with.
- The event that will trigger your response (e.g., click, mouseover, submit, etc.).
- The code or behavior that should occur when the event happens.

My event will require the user to interact with the form submission element for creating a review on the reviews page. The event that will trigger the response is clicking on the submit button. This will trigger a function that displays a preview of the review the user wrote as others would see it.

### B. Draw an Event Handling Flowchart

Create a flowchart that visually represents your event-handling process. Use the examples above as a reference.
